Multi Laps

Four stopwatches.
One screen.
Every lap.

Marketing kit, version 0.1.0

Positioning

MultiLaps is a lap timer for the person standing at the trackside with more than one runner to watch. It puts four stopwatches on one screen, each in its runner's colour, so nobody's lap gets missed while you fumble between timers.

Best for	A parent or volunteer coach timing two to four children by hand at a running track, where the runners set off at different moments and each lap matters to them. Also swimming lengths, cycling laps and school sports days. Not for: races with timing chips, groups larger than four, or anyone who needs results exported today.
Category	A multi-runner lap stopwatch for Android. People will look for it as "multiple stopwatch" or "lap timer".
What people use now	• The phone's built-in clock app, which times one runner. The second child gets timed by guesswork. • Two phones, or a phone and a wristwatch, one in each hand. • A handheld sports stopwatch, one per runner, and a clipboard. • General "multi timer" apps built for cooking or workouts: long lists, small buttons, adverts between you and the Lap button.
Why they fall short	They are built for one thing being timed, or for timers you set and walk away from. At the track you are watching children, not a screen, and you have about a second to press the right button for the right child.
What is different	• **Four at once, always visible.** No list to scroll and no switching. Turn the phone on its side and they sit in a row. • **Found by colour.** Each stopwatch is a solid block in its runner's colour, with their name on it. • **Built around the Lap press.** Lap is the big button. Stop is small and off to the side. A double press is ignored instead of recording a bogus lap. • **Hard to lose a time.** A reset can be undone for five seconds. Timing carries on if the screen locks, a call comes in or the app is closed. • **Nothing in the way.** No adverts, no account, no internet connection.
Proof you can state today	• The app asks for one permission: to vibrate. It cannot reach the internet. • Every behaviour above is covered by an automated test; the suite has 269. • Text meets the contrast level set for small print on all eight colours. There are no user reviews or usage numbers yet. Do not invent any.

Positioning in one sentence

For parents and coaches who time several runners by hand, MultiLaps is a lap stopwatch that shows four runners at once, each in their own colour. Unlike the clock app on your phone, it never makes you choose which child to time.

Messaging

Say what it does in the words a parent at a track would use. The product is simple; the copy should be too.

Taglines

Recommended

Four stopwatches. One screen. Every lap.

States the whole product in six words and promises the outcome that matters: no missed laps.

Alternative, for parents

Time all your runners at once.

The plainest version. Use where there is room for only one line.

Alternative, the problem

Two kids. One stopwatch. Sound familiar?

Names the moment the app exists for. Good for a social post, too knowing for a store title.

Three things to say, in this order

1. Everyone at once	Four stopwatches side by side. Start each runner when they actually set off, or start them all together.
2. Laps without looking	One big Lap button per runner, a different vibration for lap and stop, and each runner's current, last and best lap on their tile.
3. Nothing gets lost	Undo a reset. Lock the screen, take a call, close the app: the timing is still running when you come back.

Voice

Do

- Write the way one parent tells another about a useful app.
- Use the track's words: lap, runner, start, stop, best lap.
- Be specific. "Four runners", "five seconds to undo", "one permission".
- Say what it does not do, plainly. It builds trust.

Avoid

- Performance talk: "elite", "pro", "train smarter", "unlock your potential". This is for children having a run.
- Calling it accurate to a hundredth. It shows hundredths, but a thumb decides the time.
- Exclamation marks, and any claim about how many people use it.
- "Timer" for the product. A timer counts down; this is a stopwatch.

Google Play listing

Ready to paste. Character counts are against Google Play's limits.

App name (28 of 30 characters)

MultiLaps: 4 Lap Stopwatches

Short description (74 of 80 characters)

Time four runners at once. Big lap buttons, best laps, no ads, no account.

Full description (1,555 of 4,000 characters)

Two kids on the track and one stopwatch on your phone. You time one of them properly and guess the other.

MultiLaps puts four stopwatches on one screen, so every runner gets their own.

Everyone at once
Four stopwatches, each a solid block of colour with the runner's name on it. Start each one when that runner sets off, or press Start all when they go together. Turn the phone on its side and they line up in a row.

Made for the Lap press
Lap is the big button on every stopwatch. Stop is small and out of the way, so you do not hit it by mistake at the line. Each press gives a short vibration, different for a lap and a stop, so you can keep your eyes on the track. A double press is ignored instead of recording a lap that never happened.

The numbers that matter
Each stopwatch shows the lap in progress in large digits, with the last lap, best lap, total time and lap count beneath. Tap a name to see every lap, with the best one marked.

Hard to lose a time
Reset by mistake? Undo it within five seconds. Screen locked, call came in, app closed? The stopwatches are still running when you come back. The screen stays on while anything is being timed.

Yours to set up
Name each stopwatch and pick its colour from eight. They stay as you set them. Light and dark themes follow your phone.

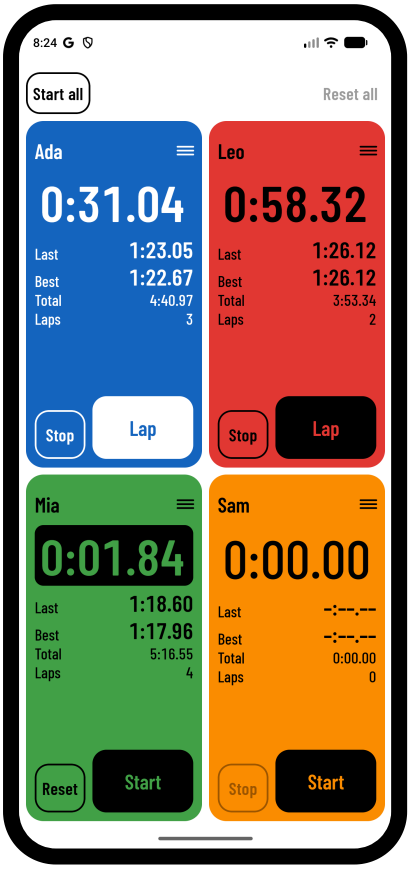

Nothing in the way
No ads. No account. No internet connection: the app cannot go online, and nothing you time leaves your phone.

MultiLaps times up to four runners and keeps their laps until you reset. It does not yet save past sessions or export results.

Category	Sports (second choice: Health & Fitness)
Tags to choose	Stopwatch, Running, Sports coaching
Search phrases to work in	multiple stopwatch, lap timer, lap stopwatch, track stopwatch, split timer for runners, coach stopwatch, sports day timer
What's new, first release	First release. Four stopwatches on one screen, each with its own laps, name and colour.

Screenshots

Six store screenshots, in the order to upload them, each with the caption to set above it. All are taken from the app itself on a Pixel emulator, with invented runners.

1. Time four runners at once

Lead with this one. Two running, one finished, one waiting: the whole idea in a glance.

2. Start each runner, or all together

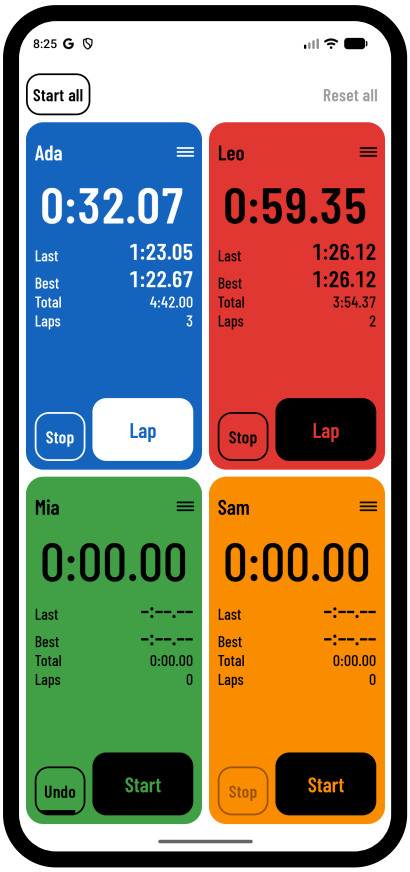

Names and colours set, nothing started. Start all is at the top left.

3. Every lap, with the best one marked

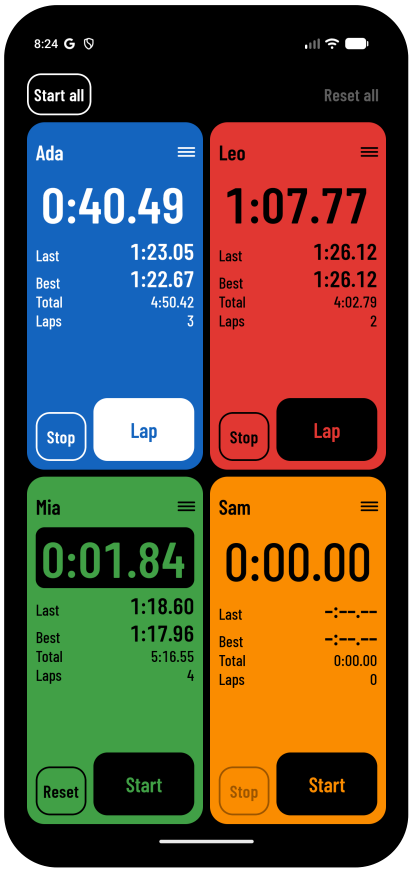

Tap a name for the lap list. The name and colour are changed here too.

Screenshots, continued

4. Reset by mistake? Undo it

After a reset the button reads Undo, with a bar that runs down over five seconds.

5. Light by day, dark at dusk

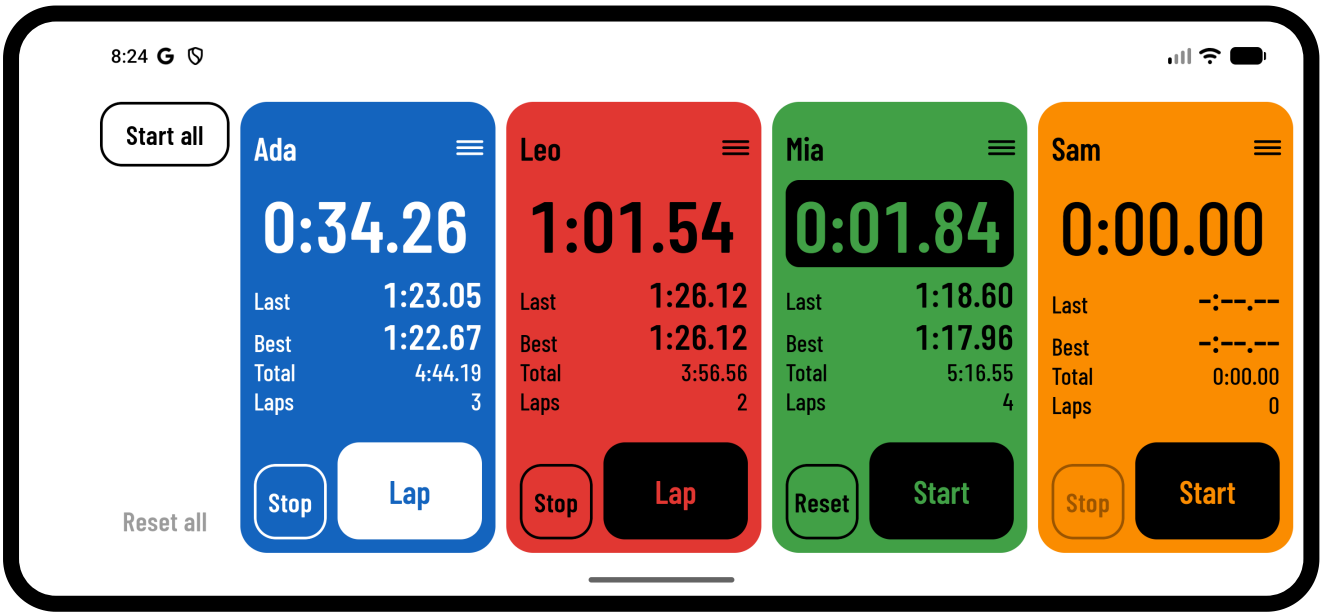

Follows the phone's light or dark setting. The colours stay the same.

Caption style

Set captions in Barlow Condensed SemiBold, black on white or white on black, above the phone. Sentence case, no full stop, no more than seven words.

Sizes

Portrait captures are 1280 × 2856 px. Google Play wants each side between 320 and 3840 px and no more than twice as long as it is wide, so crop the height to 2560 px or place the capture on a 9:16 canvas with the caption.

6. Turn it sideways for a row of four

On its side the four stopwatches line up, with Start all and Reset all in a column at the left.

Feature copy

Short blocks for a web page, a flyer for the club noticeboard, or the body of a post. Each leads with what the person gets.

Nobody waits their turn

Four stopwatches share the screen. Start each runner when they set off, even if that is ten seconds apart, or press Start all when they go together.

Find your runner by colour

Every stopwatch is a solid block of colour with a name on it. You look for blue, not for a line of small print.

A Lap button you cannot miss

Lap takes up most of the bottom of each stopwatch. Stop is the small one beside it, so a hurried thumb records a lap instead of ending the run.

Feel it, do not look for it

One short buzz for a lap, two for a stop. You know the press counted without taking your eyes off the track.

Current, last and best

The lap in progress is the biggest thing on the tile. The last lap and the best lap sit right under it, ready for the question every child asks at the line.

Mistakes do not cost a time

A second press too soon is ignored. A reset can be taken back for five seconds, and so can Reset all.

Keeps going when your phone does not

Lock the screen, answer a call or close the app. The stopwatches carry on, and they are right where they should be when you return.

Sideways for a row of four

Turn the phone on its side and the stopwatches line up left to right, like lanes.

Set up once

Give each stopwatch a name and one of eight colours. They are still there next week.

No ads, no account, no internet

The app asks for one permission, to vibrate. It has no way to go online, so nothing you time leaves your phone.

Feature graphic

A layout for the 1024 × 500 px banner Google Play requires, shown at reduced size. The full-size file is in `docs/play-store/`.

Launch copy

Announcements at three lengths. Each ends with one thing to do: get the app. Add the store link where it says [link].

One line, for a bio or a message to another parent

MultiLaps: four lap stopwatches on one screen, so you can time all your runners at once. [link]

Short post, for social media or a club group chat

Two kids on the track, one stopwatch on my phone. I got tired of timing one and guessing the other, so I built MultiLaps.

Four stopwatches on one screen, each in its own colour. A big Lap button for every runner. Their current, last and best lap right there. No ads, no account.

It is on Android now. Get MultiLaps: [link]

Longer post, for a blog, a newsletter or a club email

Subject: An app for timing more than one runner

If you have ever stood at the side of a track with two children running and one stopwatch, you know the problem. You time one of them. The other one asks for their lap time and you make something up.

I built MultiLaps to fix that. It shows four stopwatches at once, each a block of colour with a runner's name on it. You start each one when that runner sets off, press their Lap button each time they come round, and the app keeps their current, last and best lap in view.

A few things I cared about because of how it gets used:

- Lap is the big button and Stop is the small one, because the wrong press at the line is the one you cannot take back.
- Each press buzzes, differently for a lap and a stop, so you can watch the runners and not the phone.
- If you reset by mistake you have five seconds to undo it.
- It keeps timing if the screen locks or the app closes.
- There are no ads and no account, and it does not use the internet.

It times up to four runners. It does not save past sessions yet; that is next.

MultiLaps is on Android. Get it here: [link]

Store button and link text

Use	"Get MultiLaps", or "Get it on Google Play", which is Google's own badge wording
Avoid	"Download now", "Learn more", "Sign up". There is nothing to sign up for.

Questions and facts

Answers to what people will ask before they install, and the facts to check any copy against.

Questions people will ask

Can I time more than four?	No. Four is what fits on a phone screen with buttons big enough to press in a hurry.
Do they all have to start together?	No. Each stopwatch starts on its own. Start all is there for when they do go together; it starts every stopwatch that has not been started and leaves the rest alone.
What if I press the wrong thing?	A second press within a second is ignored. A reset, or Reset all, can be undone for five seconds.
What if my phone locks or the app closes?	The stopwatches keep running. They also carry on through a phone restart, to the nearest the phone's own clock allows.
Does it save past sessions?	Not yet. Laps stay until you reset. Saved history is the next thing planned.
Does it need the internet or an account?	No. The app cannot go online and there is nothing to sign in to.
Why does it ask to vibrate?	So you can feel each press. It is the only permission the app asks for.
I felt no vibration.	The buzz follows the phone's main vibration switch and its alarm vibration level. It is also silenced by Do Not Disturb when that is set to total silence.

Fact sheet

Name	MultiLaps
Platform	Android 8.0 and later, phones. Tablets get the same layout.
Version	0.1.0
Package	com.swetw.multilaps
Stopwatches	Four, each with a name (up to 20 characters) and one of eight colours
Times shown	To a hundredth of a second; hours appear past 59:59.99
Permissions	Vibrate. Nothing else; no internet access.
Data	Names, colours and timing are kept on the phone only. Not backed up and not sent anywhere.
Language	English
Typeface	Barlow Condensed, under the SIL Open Font License
Price	Not decided. Do not print "free" until it is.
Publisher name	Not decided.

Before you publish

What this kit does not settle. The copy is written to be true of the app as it stands; these are the places where a claim needs checking or a piece is still missing.

Claims to confirm on a real phone

1. **The release build.** Everything so far was checked on test builds. The signed build that goes to Google Play has not been run on a phone; internal testing will be its first run.
2. **Sunlight.** The contrast is measured, but nobody has yet read the screen at arm's length in sunlight. No line in this kit claims it; do not add one untested.
3. **"Carries on through a restart."** Covered by tests only; never tried by restarting a phone mid-timing. The copy says "to the nearest the phone's own clock allows" for that reason.
4. **Android 9 and 10.** On those versions a phone with touch feedback off will not vibrate. The listing does not promise otherwise, but a reviewer may notice.

Decisions the copy is waiting on

1. **Price.** No line in this kit says "free". Add it once decided; it belongs in the short description.
2. **Publisher name and contact email**, both required by Google Play.
3. **The package name** com.swetw.multilaps is permanent once published. Convention expects you to control swetw.com.
4. **Privacy policy.** Written, as `PRIVACY.md` at the top of the repository. It still needs the publisher name and contact email from decision 2.

Assets

1. **Made**, in `docs/play-store/`: the feature graphic at 1024 × 500 px, the store icon at 512 × 512 px, and six captioned screenshots.
2. **Still to make, optional: a short video.** Fifteen seconds of four runners being lapped would show the idea faster than any caption.

What not to say

- No testimonials, ratings, download counts or "trusted by" lines until they exist.
- Nothing about saving, sharing or exporting results. The app does none of these yet.
- No claim of precision beyond "shows hundredths". The time is taken by hand.
